#### Abstract

The trisaccharide 2,3,4-O-tribenzyl- $\alpha$-L-rhamnosyl( $1 \rightarrow 3$ )-4-O-acetyl-2-O-benzoyl-( $1 \rightarrow 2$ )-4-O-acetyl-3- $O$-benzoyl-$\alpha$-L-rhamnosyl-1-(4-tolyl)thio- $\alpha$-L-rhamnopyranoside was prepared from the thio-sugar 1 -(4-tolyl)thio- $\alpha, \beta$-L-rhamnopyranoside from the nonreducing end to the reducing end. The two acceptors possessing 2 - and 3-OH groups for the construction of the trisaccharide were obtained from a 2,3-benzylidine-protected thio-sugar in a one-pot deprotection manner in a respective ratio of $1: 2.5$. As donors for glycosylation, the thio-sugars of both mono- and disaccharides were converted to trichloroacetimido rhamnosides. Through this chemoselective strategy, a trisaccharide was obtained that retained an anomeric thio group for coupling with ceramide moieties. Bioassays are in progress.

Lipopolysaccharide (LPS), also called endotoxin, is found in Gram-negative bacteria in which it forms the major anchoring component of the membrane surface. ${ }^{1}$ LPS is comprised of two components, namely, lipid A and polysaccharide. ${ }^{2}$ The exterior polysaccharide portion is composed of three types of saccharide moieties termed the inner core, outer core and O-specific chain. Of these, the O-specific chain is an invariant repeating unit of oligosaccharides. When mammalians ingest a small amount of LPS, their immune system will respond to this foreign molecule by stimulating slight inflammatory effects, the symptoms of which are negligible, however, in cases when large amounts of LPS is taken in, this may result in high fever, septic shock or even death. The saccharide portion has been recognized to be a key player in triggering this immune response. Through the recent study of this specific glycan-glycan interaction between pathogens and their hosts, glycoconjugates have acquired a new terminology: glycosynapse. ${ }^{3}$

LPS was believed to exert its damaging bioactivity through a two-step process: inducing a general immune response by the lipid A portion, and targeting cells expressing biomolecules bearing a structural resemblance to the saccharide portion of LPS. Thus, modification of the structure of LPS to redirect the intrinsic immune responses specifically against some diseases such as cancer cells

has become an emerging interest in recent glycobiology field. The synthesis of such molecules, with characteristics that could initiate immuno-recognition, is of critical importance for the study of possible cancer vaccines. For example, the synthetic alpha-gal ceramide has been extensively investigated for its ability to induce prominent immune response of natural killer T cells, mediated by signaling CD1d molecules. ${ }^{4,5}$
Among these glycoconjugates, the repeating units are thought to play a central role in tuning the immune specificity. We are interested in the development of glycoceramide derivatives and have focused especially on the assembly of the glyco portion of the trisaccharide moiety of rhamnose. While rhamnose has been reported to be a rare sugar component found in natural LPS or in some herbs such as Reishi, ${ }^{6}$ some strains of bacteria, such as Pseudomonas syringae pv. coronafaciens IMV 9030 and atrofaciens IMV 8281 were found to possess this specific sequence of $\alpha$-L-rha $(1 \rightarrow 3) \alpha$-L-rha $(1 \rightarrow 2) \alpha$-L-rha. ${ }^{7,8}$ Furthermore, a tetrasaccharide comprising these three rhamnose residues has been recognized as the antigen determinant responsible for the toxin of Bacillus anthracis. ${ }^{9,10}$
Herein, we report the facile preparation of a trisaccharide of rhamnose 26 bearing a thio group ready for subsequent glycosylation with ceramide. ${ }^{11}$ As the ceramide moiety was synthesized via a multi-step synthesis, our trisaccharide portion 1 was assembled first. The retrosynthetic analysis of this trisaccharide moiety is shown in Scheme 1.
Encouraged by the recent success of constructing oligosialic acids via chemoselective glycosylation with alternate thio and phosphite glycosides, ${ }^{12}$ we attempted to assemble the trisaccharide unit from the nonreducing end to the reducing end. Due to the importance of protecting groups with respect to tuning the reactivity of glycosylation, we initially synthesized and compared both etherand ester-type protecting groups. Preparation of the three thio donors 8, $\mathbf{1 0}$ and $\mathbf{1 1}$ was achieved via peracetylation ${ }^{13}$ of the four hydroxyl groups of rhamnose 6, introduction of a 4-thiotolyl group, ${ }^{14}$ deprotection of the hydroxyl groups ${ }^{14}$ and, finally, protection with benzyl ${ }^{15}$ and benzoyl groups (Scheme 2).
After removal of the thio groups, the three hemiacetals $\mathbf{1 2},{ }^{13,16} \mathbf{1 3}{ }^{17}$ and $\mathbf{1 4},{ }^{18}$ were obtained in high yields. Upon introduction of the trichloroacetamido groups, the three

imidates $\mathbf{5},{ }^{16 \mathrm{c}} \mathbf{1 5},{ }^{17 \mathrm{a}}$ and $\mathbf{1 6},{ }^{19}$ were obtained (Scheme 3). Though no NMR spectrum was available for compound 16, the presence of a sole $\alpha$-anomer was suggested by the observation of a single spot by TLC analysis. Adjusting of the basicity of the system is a common method for con-

trolling the stereoselectivity of the imidates in benzyl-protected rhamnose. ${ }^{17 a}$ For example, $\alpha$ - and $\beta$-imidates could be independently prepared by using either a strong base (e.g. NaH ) or a weak base (e.g. $\mathrm{K}_{2} \mathrm{CO}_{3}$ ), respectively. However, no analogous rules for either acetyl- or benzoylprotected rhamnose could be found in the literature. Common bases used for the preparation of acetyl- and benzoylprotected imidates have been cesium carbonate or a combination of potassium carbonate and 1,8-diazabicy-clo[5.4.0]undec-7-ene (DBU), respectively. The $\alpha-$ configurational assignments of the three imidates 15, 5 and $\mathbf{1 6}$ were made on the basis of empirical data. ${ }^{16 c, 19,20}$
While an efficient preparation of an acceptor bearing a 3OH group has been reported, a corresponding, facile procedure for the preparation of the $2-\mathrm{OH}$ isomer remains a challenge. ${ }^{21,22}$ The typical four-step synthesis of the 2-OH acceptor, starting from acetyl-protected 1-bromorhamnoside via reaction with sym-collidine and subsequent deprotection, was relatively lengthy and low-yielding ( $24 \%$ ). Our preparation of both acceptors 19 and 20, simultaneously, was achieved in three steps (Scheme 4).

Attempts at coupling the donor 5 with acceptor 19 failed to provide the corresponding disaccharide due to the propensity of the p-methoxyphenyl (PMB) group to be eliminated. This group was therefore replaced by a more stable ester-type protecting group. For convenience, a mixture of compounds 19 and 20 was protected with the benzoyl group to provide a mixture of $\mathbf{2 1}$ and $\mathbf{2 2}$; however, these compounds could not be separated by column chromatography. Following deprotection with cerium(IV) ammonium nitrate (CAN), the mixture of compounds 4 and 2 obtained could only be partially ( $\sim 30 \%$ ) purified by chromatography. For analytical purposes, further purification of samples of the isolated compounds 4 and 2 by HPLC was performed. Due to the problems with purification, the two isomers were chromatographically separated at an earlier stage of the preparation; taking advantage of the

subtle $R_{f}$ differences ( $6 \%$ ), compounds 19 and 20 could be separated by chromatography. As indicated in Table 1, the glycosylation yield of the three donors was satisfactory, particularly in the case of the ester-protected sugar 15.

Disaccharide 23 was also obtained (Scheme 5) which, through application of the method shown in Scheme 2, was used to form the imidate of disaccharide 25 (76\% yield from 23; Scheme 6). Coupling of 25 with the $2-\mathrm{OH}$ acceptor $\mathbf{2}$ gave the trisaccharide $\mathbf{2 6}$ in high yield.

In brief, the current method provides a facile route for the preparation of two acceptors 4 and 2 , simultaneously, which can be easily separated by column chromatography. The glycosylation yield was improved when more reactive, ester-protected donors $\mathbf{1 5}$ and $\mathbf{1 6}$ were added. The glycosylation of trisaccharide donor 26 with ceramide acceptors is in progress.

NMR spectroscopy was performed at the department of chemistry of National Tsing-Hua University (NTHU). ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra (including DEPT-135) were recorded using 500 MHz Varian Unity INOVA instruments. ESI-QTOF mass spectroscopy was performed at the department of applied chemistry of the National Chiao Tung University (NCTU). ESI-MS spectra were recorded using a Micromass Q-Tof liquid chromatograph tandem mass spectrometer. Analytical TLC was performed using Macherey-Nagel
silica gel 60 F254 precoated plates, which were examined by UV absorption at 254 nm and visualized by staining with a solution prepared from 5\% p-anisaldehyde, sulfuric acid, acetic acid and EtOH under heating. Column chromatography employed Merck Geduran Si 60 silica gel (230-400 mesh). Solvents of either industrial grade or reagent grade (EtOAc, acetone and $n$-hexane) were distilled prior to column chromatography. Solvents of reagent grade were dried before use. DMF was distilled over $\mathrm{CaH}_{2}$ under reduced pressure and stored over $4 \AA \mathrm{MS} . \mathrm{CH}_{2} \mathrm{Cl}_{2}$ and pyridine were distilled over $\mathrm{CaH}_{2}$. THF was distilled over Na after repeated treatment with $\mathrm{FeSO}_{4}$ and KOH for the removal of peroxide. MeOH was distilled over Mg. Normal-phase HPLC (Agilent 1100) was equipped with a sample loop $(500 \mu \mathrm{~L})$ and a semipreparative column $(9.4 \times 250 \mathrm{~mm}$ ZORBAX SIL, $5 \mu \mathrm{~m}$ material). Constant conditions were used [ $n$ -hexane-EtOAc, 3:1; flow rate $3 \mathrm{~mL} / \mathrm{min}$; UV detection ( 260 nm )].

## 2,3,4-Tri- $O$-acetyl-1-(4-tolyl)thio- $\alpha$-L-rhamnopyranoside (8)

A mixture of L-rhamnose ( $7.6 \mathrm{~g}, 22.8 \mathrm{mmol}$ ), DMAP $(0.55 \mathrm{~g}, 4.5$ $\mathrm{mmol})$ and pyridine $(40 \mathrm{~mL})$ was stirred at r.t. under $\mathrm{N}_{2}$ for 10 min . $\mathrm{Ac}_{2} \mathrm{O}(23 \mathrm{~mL})$ was added and the mixture was stirred for 30 min . The reaction was followed by monitoring formation of the product $1,2,3,4-O$-tetraacetyl- $\alpha, \beta$-L-rhamnopyranoside ( $7 ; R_{f}=0.86$ ) by TLC ( $n$-hexane-EtOAc, 1:1). Upon completion, the solvent was removed under reduced pressure and the crude mixture was purified by column chromatography ( $n$-hexane-EtOAc, 1:1) to provide a mixture of the products in $95 \%$ yield $(14.3 \mathrm{~g})$. A portion of this mixture ( $2.42 \mathrm{~g}, 7.27 \mathrm{mmol}$ ) and $p$-thiocresol $(1.24 \mathrm{~g}, 8.42 \mathrm{mmol})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ and the solution was cooled to $0^{\circ} \mathrm{C}$. To the solution was added $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}(2.06 \mathrm{~mL}, 14.6 \mathrm{mmol})$ slowly under $\mathrm{N}_{2}$. The reaction mixture was warmed to r.t. and stirred for 60 min until the starting material $\left(R_{f}=0.22 ; n\right.$-hexane-EtOAc, 7:3) was consumed and the products $8\left(R_{f}=0.55\right.$ and $\left.R_{f}=0.45\right)$ were formed. After the removal of the volatile solvents, the residue was partitioned between $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$ and sat. aq solutions of $\mathrm{NaHCO}_{3}(15 \mathrm{~mL}), \mathrm{NaCl}(15 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ sequentially. The organic layer was then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated and the residue was purified by column chromatography on silica gel ( $n$ -hexane-EtOAc, 3:1) to give 8.

A mixture of compound $\mathbf{1 7 \alpha}, \boldsymbol{\beta}$ ( $157 \mathrm{mg}, 0.4 \mathrm{mmol}$ ), DMAP ( 13.8 $\mathrm{mg}, 0.1 \mathrm{mmol})$ and pyridine $(0.8 \mathrm{~mL})$ was stirred for $20 \mathrm{~min} . \mathrm{Ac}_{2} \mathrm{O}$ $(0.5 \mathrm{~mL})$ was added and the reaction was stirred at r.t. for 30 min . Products $18 \alpha$ and $18 \beta$ (both $R_{f}=0.61$ ) were detected on TLC ( $n$ -hexane-EtOAc, 7:3). After removal of the volatile solvents, the crude product was purified by column chromatography on silica gel ( $n$-hexane-EtOAc, 4:1) to give a mixture of $\mathbf{1 8 \alpha}$ and $\mathbf{1 8 \beta}$ in $97 \%$ yield ( 147 mg ) in a ratio of $2: 3$ respectively. An analytical sample was further purified with normal phase HPLC to provide pure $\mathbf{1 8 \alpha}$ and $18 \beta$.

## 2,3,4-O-Tribenzyl-L-rhamnopyranoside ( $13 \alpha, \beta$ )

A mixture of compounds $\mathbf{1 0 \alpha}(844 \mathrm{mg}, 1.6 \mathrm{mmol})$, NBS $(565 \mathrm{mg}$, $3.2 \mathrm{mmol})$ and acetone $-\mathrm{H}_{2} \mathrm{O}(1: 1,10 \mathrm{~mL})$ was stirred at r.t. for 1 h . The reaction was monitored by TLC ( $n$-hexane-EtOAc, 7:3). NBS ( $282 \mathrm{mg}, 1.6 \mathrm{mmol}$ ) was added and the solution was stirred for a further 1 h . The starting material $\left(R_{f}=0.67\right)$ was consumed, while the products $\mathbf{1 0 \alpha}, \boldsymbol{\beta}\left(R_{f}=0.32\right)$ formed. After the removal of the volatile solvents, the crude product was purified by column chromatography on silica gel ( $n$-hexane-EtOAc, 1:3) to give 10 $\boldsymbol{\alpha}, \boldsymbol{\beta}(91 \%, 620 \mathrm{mg}$ ).
MS (ESI+Q-TOF): $m / z=457.1[\mathrm{M}+\mathrm{Na}]^{+}$.

## 2,3,4- $O$-Tribenzoyl- $\alpha, \beta$-L-rhamnopyranoside ( $14 \alpha, \beta$ )

A mixture of compounds $\mathbf{1 1 \boldsymbol { \alpha }}, \boldsymbol{\beta}(169 \mathrm{mg}, 0.29 \mathrm{mmol}), \mathrm{NBS}(107$ $\mathrm{mg}, 0.6 \mathrm{mmol})$ and acetone $-\mathrm{H}_{2} \mathrm{O}(1: 2,4 \mathrm{~mL})$ was stirred at r.t. for 1 h. The reaction was monitored by TLC ( $n$-hexane-EtOAc, 7:3). NBS ( $51 \mathrm{mg}, 0.29 \mathrm{mmol}$ ) was added and stirring was continued for 1 h . The starting material $\left(R_{f}=0.72\right)$ was consumed, while the products 14 $\boldsymbol{\alpha}, \boldsymbol{\beta}\left(R_{f}=0.36\right)$ was formed. After the removal of the volatile solvents, the crude products were purified by column chromatography on silica gel ( $n$-hexane-EtOAc, 9:2) to give 14 $\boldsymbol{\alpha}, \boldsymbol{\beta}$ (93\%, 129 mg ).
MS (ESI+Q-TOF): $m / z=499.1[\mathrm{M}+\mathrm{Na}]^{+}$.

## 2,3,4-O-Triacetyl- $\alpha, \boldsymbol{\beta}$-L-rhamnopyranoside (12)

Compound $\mathbf{1 2}$ was prepared using the procedure described above. Compound 8 ( $144 \mathrm{mg}, 0.4 \mathrm{mmol}$ ), NBS ( $108 \mathrm{mg}, 0.6 \mathrm{mmol}$ ) and acetone $-\mathrm{H}_{2} \mathrm{O}(9: 1,6 \mathrm{~mL})$ were employed. Purification by column chromatography ( $n$-hexane-EtOAc, 7:4) gave pure 12.
Yield: $95 \%$ ( 100 mg ); $R_{f}=0.2$ ( $n$-hexane-EtOAc, 3:7).
MS (ESI+Q-TOF): $m / z=313.3[\mathrm{M}+\mathrm{Na}]^{+}$.

A mixture of compound $4(90 \mathrm{mg}, 0.22 \mathrm{mmol}), 4 \AA$ molecular sieves $(220 \mathrm{mg})$ and compound $5(130 \mathrm{mg}, 0.23 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 mL ) was stirred at r.t. for 30 min then cooled to $0^{\circ} \mathrm{C}$. TMSOTf $(19 \mu \mathrm{~L}, 0.11 \mathrm{mmol})$ was added and the reaction mixture was stirred for 30 min and then warmed to r.t. The product $21\left(R_{f}=0.65\right)$ was detected on TLC ( $n$-hexane-EtOAc, 7:3). After completion of the reaction, the reaction mixture was quenched with $\mathrm{Et}_{3} \mathrm{~N}(0.5 \mathrm{~mL})$, diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ and filtered. After concentration, the residue was purified by column chromatography on silica gel ( $n$ -hexane-EtOAc, 9:2) to give $21(78 \%, 64 \mathrm{mg})$.

 zoyl-(1 $\rightarrow$ 2)-4-O-acetyl-3- $O$-benzoyl- $\alpha$-L-rhamnosyl-1-(4-tolyl)thio- $\alpha$-L-rhamnopyranoside (26)A mixture of compound $25(23 \mathrm{mg}, 0.03 \mathrm{mmol}), \mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{~mL})$, compound $2(7 \mathrm{mg}, 0.02)$ and $4 \AA$ molecular sieves ( 30 mg ) was stirred at r.t. for 30 min then cooled to $0^{\circ} \mathrm{C}$. To the solution was added TMSOTf $(0.3 \mu \mathrm{~L}, 0.01 \mathrm{mmol})$, prepared by the addition of TMSOTf $(100 \mu \mathrm{~L})$ to $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$. After stirring at $0^{\circ} \mathrm{C}$ for 15 min, the mixture was warmed to r.t. and formation of the product 26
was monitored by TLC ( $R_{f}=0.5$; $n$-hexane-EtOAc, 7:3). The mixture was quenched with $\mathrm{Et}_{3} \mathrm{~N}(0.5 \mathrm{~mL})$, diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10$ mL ) and filtered. After removal of the volatile solvents, the crude residue was purified by column chromatography on silica gel ( $n$ -hexane-EtOAc, 8:3) to give $26(84 \%, 15 \mathrm{mg})$.
